

One link. A bar that fills itself from **every chain.**

It pays out together, or refunds everyone — automatically. Conditional group money: the pot is a contract, and nobody holds the money. Including us.

Arbitrum bounty

Magic bonus

THIS IS RALLY

Group money that pays out **together.**

Or refunds everyone — automatically. Live on Arbitrum.

THE PROBLEM

Group money has no owner.

2021

PayPal shut down **Money Pools** — and never replaced it. The best-known group-money product simply vanished.

Largest

Rotating savings circles — chit funds, tandas, susus — are the **world's largest informal financial instrument**. They still run on a trusted foreman who can walk off with the pot.

why

Every group-money product before this died of the same thing: **somebody had to hold the money.**

The money that actually pools is money between people who *know each other* — and nobody owns that primitive.

Two shapes of one promise.

Goals — hit it together, or everyone's refunded

All-or-nothing. "Tokyo trip — \$2,000 by Friday." The bar fills live, colored by the chains the money came from. Goal hit → one consolidated payout. Missed → **every backer reclaims automatically.**

Circles — the pot rotates, every round

The savings circle, with the foreman replaced by an **ownerless contract**. Everyone chips in each round; one member takes the pot; the turn rotates. Anyone misses → the circle stops and **everyone still holding a deposit is refunded.**

Email → amount → done.

no wallet Sign in with an email code. An embedded wallet is minted behind it — no extension, no seed phrase.

no gas Every transaction is sponsored. Backers never hold ETH, on any chain.

no bridge Chip in USDC from whatever chain you hold it on. It lands in the vault on Arbitrum ~10 seconds later.

no chain No network picker anywhere. The chain never introduces itself.

The chain that disappears.

The user's entire interaction is email → amount → done. Everything here is invisible — which is the point.

We broke a circle on purpose. The refund rail is **proven onchain**.

Real cross-chain fills

Campaign #1 filled live: burn on Base → mint on Arbitrum, named feed, attestation measured at **9.8s**.

`0x297eb6...` (Base) → `0xc354c2...` (Arbitrum)

The circle that broke — on purpose

/circle/2's round went unfunded. The contract derived Broken and a member's deposit came back automatically.

`refund tx 0xdb9d1d5c...151729ba6`

86/86 Foundry tests

Incl. solvency invariants and two fund-conservation fuzzes green at 2,000+ runs. RotatingVault asserts $\text{balance} = \Sigma \text{deposited} - \Sigma \text{claimed}$ after every mutation.

Audited twice, independently

A 12-agent self-audit + a separate adversarial review — **zero Critical / High / Medium findings**. Both vaults verified on Arbiscan.

Distribution is a link in the group chat.

who Trip chats, families, savings committees. The groups already pooling money — with Venmo spreadsheets or a foreman's notebook.

how A web PWA. One link per pot, one invite per seat. No install, no onboarding funnel — the link is the funnel.

wedge The refund guarantee is the product. "Nobody can walk off with the pot" is what lets strangers-to-crypto say yes.

next Testnet today — no real money involved. Mainnet is the same contracts + CCTP v2 mainnet; the refund rail is already proven.

Group money that feels like passing a hat — except this hat pays out together, or hands everything back.
